

Concept-flipping curves — attnlrp\_gamma\_residual\_none · embed\_dim · colored\_mnist (n=500 imgs, N=384 detectors)  
 $\Delta(n)$  = target-class prob after perturbing the n most/least relevant detectors,  $\div$  baseline prob

— most-relevant-first: mean  $\Delta$  over images  
— least-relevant-first: mean  $\Delta$  over images  
 faint band:  $\pm 1$  std across images (population spread)  
 dark band: 95% bootstrap CI of the mean curve  
●  $\bullet$  sign-crossing  $n^\star$  on each curve (positive $\rightarrow$ negative relevance), matching colour  
  $\Delta = 1$  (no change from baseline prediction)
